

ABM MODULE: IMPORT COSTING

OVERVIEW

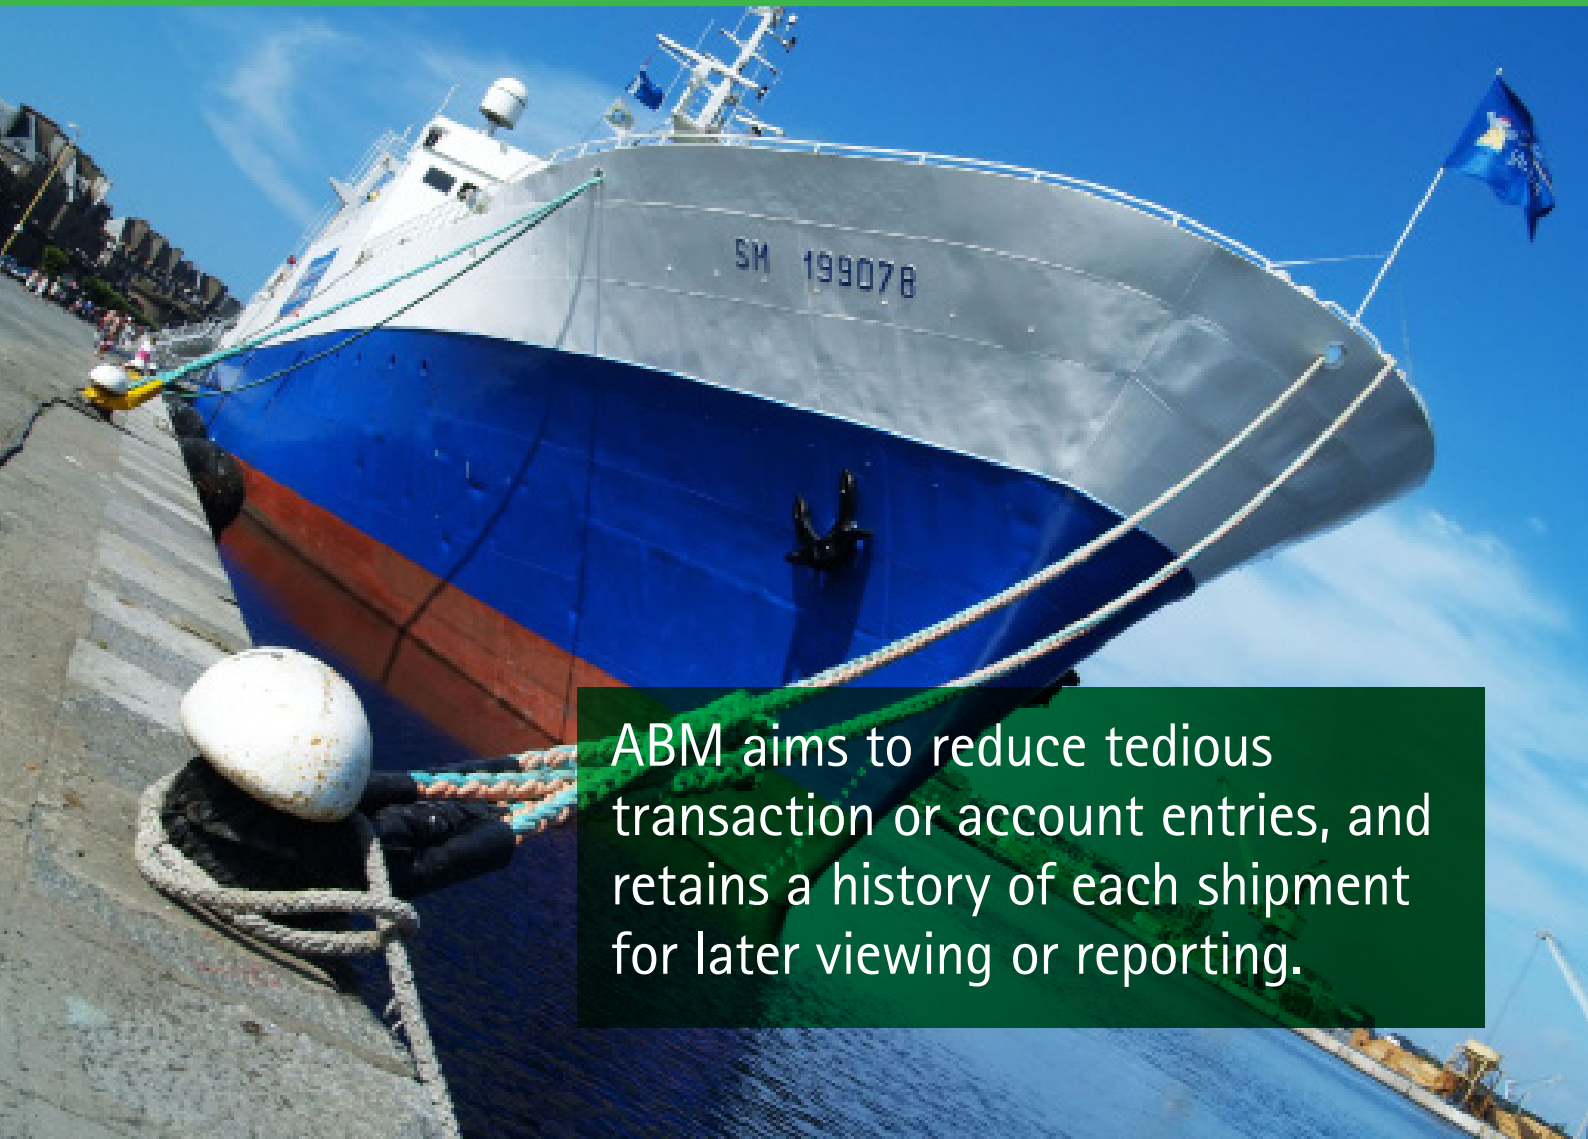

ABM's Import Costing module is ideal for businesses that need to automatically calculate the landed costs of imported inventory, by constructing 'shipments' from single or multiple existing purchase orders.

Order costs can then be entered at any stage by specifying relevant exchange rates and applying user defined shipment costs.

Based on the newly calculated unit cost, mark-up methods can also be set. When the costs have been finalised and the goods received, the shipment is then processed to update the inventory and purchase order files.

IMPROVE THE WAY YOU DO BUSINESS BY...

- » Accurately tracking changing costs
- » Controlling product margins
- » Managing shipment complexities
- » Forecasting costs and profits
- » Handling shipment alterations
- » Analysing shipment profitability

ABM aims to reduce tedious transaction or account entries, and retains a history of each shipment for later viewing or reporting.

ABM MODULE: IMPORT COSTING

FEATURES

SUNDRY SHIPMENTS

A 'sundry shipment' option is included to allow stock items to be cost estimated and selling prices set in advance of placing any orders. This allows importers to finalise prices before receiving orders from customers.

TRACK AND CHANGE

Shipments are automatically assigned a shipment number and stored in a new shipment file for easy cataloguing. Shipments can then be viewed on the shipment routine by nominated supplier. Any existing shipments still in transit are able to be altered in terms of weight, volume or value, at anytime.

ANALYSIS

Perform a 'What if' analysis to see the effect of changes in exchange rates and shipment costs on the final landed cost prior to processing. ABM's import costing module also allows you to complete price updates within shipment invoices.

ACCOUNTING INTEGRATION

General/Nominal ledger postings are automatically processed, as well as a supplier invoice for orders. ABM aims to reduce tedious transaction or account entries, and retains a history of each shipment for later viewing or reporting.

DETAILED SHIPMENTS

Shipments are constructed by selecting all or part of detailed items from orders. Additional details relevant to the shipment, such as due dates, exchange rates, country of origin and shipping line may also be entered and stored as a reference for each shipment.

DETAILED COSTING

Shipments are automatically totalled and converted to local currency at an updated exchange rate. Multiple user-defined shipment costs are available and apportioned by quantity, value, weight, volume, percentage or manually.

Shipments are automatically totalled and converted to local currency at an updated exchange rate.
